

Android Recompiler & Signer
Security Lab CS460
tjmille2 jhamill2

Dependencies:

1. Must have apktool & openssl installed
2. Android SDK
3. Java SDK 1.8

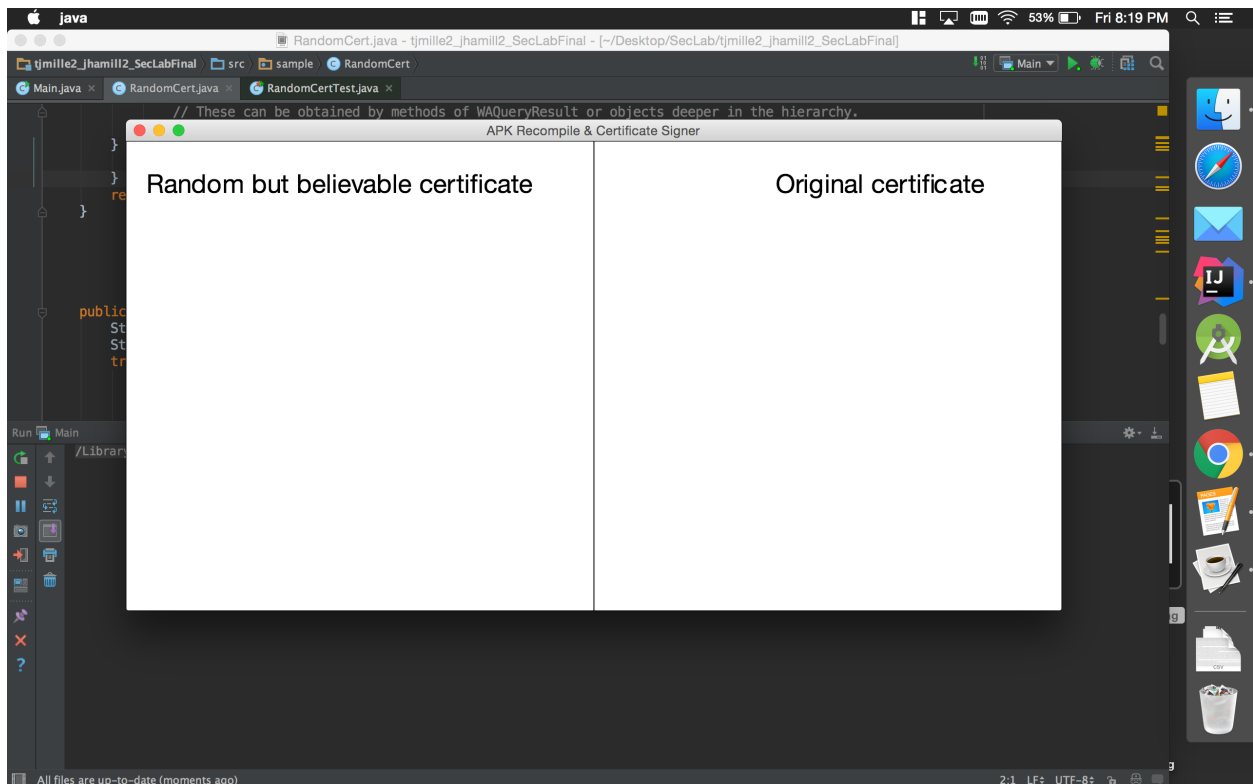

Prerequisites:

- Drag/Drop to right side works for all signed apk files
- Drag/Drop to left side works for all APKs from the Google Play store

Getting Started:

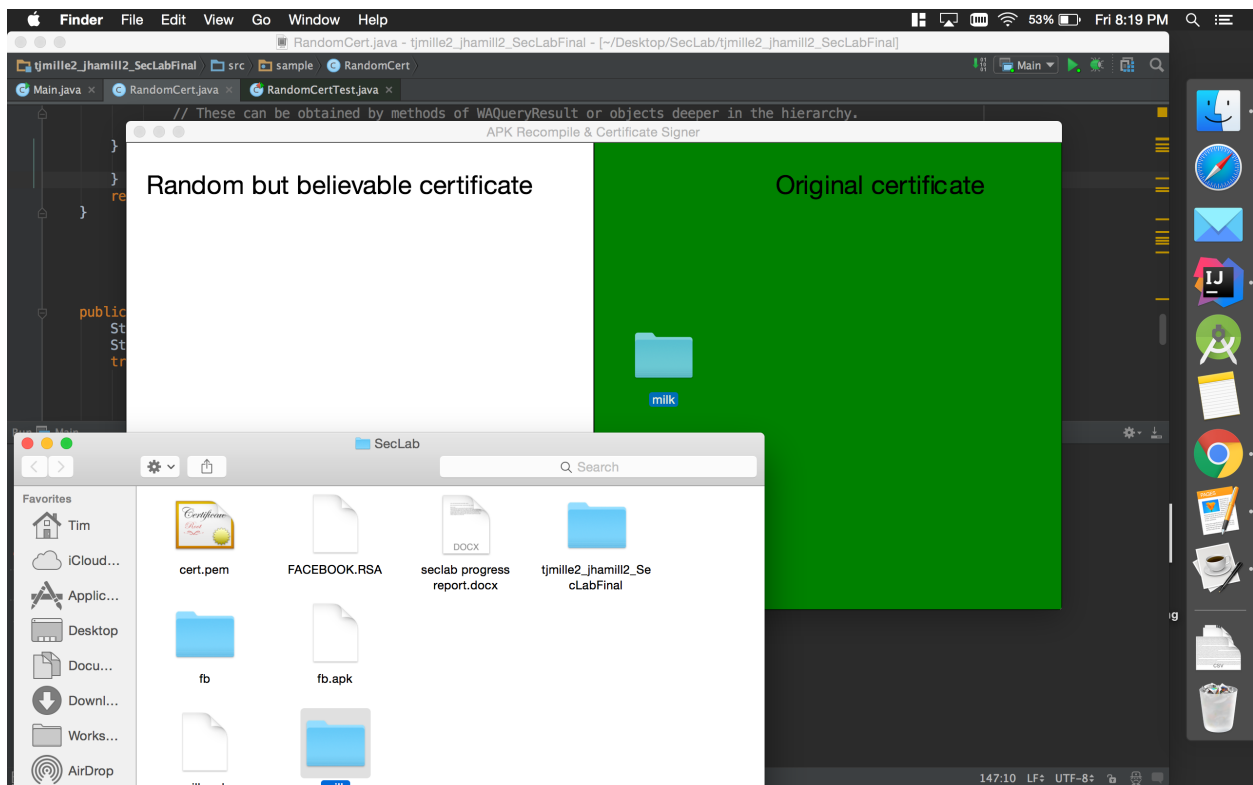

Run the .jar from terminal

The program should look like this.

How to use:

1. Drag the root folder of a decompiled apk.
2. Release on either the right or left side of the window to sign with a recreated version of the original keystore with the same parameters (right side) or a randomly generated, but believable version of the same parameters (left side).

3. Path to the signed apk is shown in the dialog shown upon a successful run.
4. Program will close after hitting OK.
